

Surgery nurse services

Our surgery nurse services help injured employees prepare their mind and body before surgery, and provide them with educational tools and guidance to improve their recovery.

Workers' compensation claims involving surgery typically cost nine times more than non-surgical claims and take longer to close. When an injured employee is engaged in their recovery, before and after surgery, it can reduce the likelihood of costly complications, improve recovery times and facilitate a safe, healthy return to work.

Being told that surgery is needed can be a chilling experience for most people. Often, surgery is complicated by pre-existing conditions such as obesity, diabetes or hypertension. Sedgwick's surgery nurse services help manage high cost surgical claims more effectively by proactively engaging injured employees. This unique solution provides dedicated nurse resources and technology to help these employees take steps to prepare for surgery and improve their recovery.

How it works

Pre-habilitation

Our pre-habilitation program encompasses five core pillars that address medical literacy, anxiety and pain, nutrition and healing, physical mobility and surgery preparedness. The surgery nurse develops a relationship with the injured employee and provides education, sets expectations, and explores the areas in the pillars for potential concerns or red flags.

Rehabilitation

Following surgery, our nurse manages the recovery process focusing on immediate post-op care, medication management, physical therapy and return to work.

Key results

After comparing surgical claims with and without our surgery nurse program, claims where these services were used achieved the following results on average post surgery:

27% *fewer temporary total disability days*

15% *fewer physical therapy visits*

25% *lower paid per claim*

Success stories

This pre-habilitation/rehabilitation model is providing impressive results for employers and injured employees. The powerful combination of clinical intervention and innovative technology is lowering claim costs, improving outcomes and helping employees return to work sooner.

- Rita, a 48-year-old patient, was preparing for outpatient surgery when surgery nurse, Paula, was assigned to support her case. Paula learned during their initial discussion that Rita had a heart attack at age 44, which raised concerns – pre-op cardiac testing had not yet been done for clearance, and this patient with heart attack history was scheduled for outpatient instead of inpatient surgery. Paula contacted the surgeon, and he immediately scheduled testing with a cardiologist and changed the procedure to inpatient. Although Rita had been very nervous about the surgery, she said that the support from Paula, as well as the relaxation exercises, really eased her anxiety.
- Jen was approaching surgery with extreme anxiety and dread. Her attorney would not agree to telephonic case management intervention, but was intrigued by the idea of surgery nurse engagement (something he had never heard about before) and allowed contact. Jen said that the mindfulness sessions helped her learn to relax and also deal with post-op pain. In fact, she now prefers mindfulness meditation over pain medication, because mindfulness keeps her feeling good and the medication makes her feel foggy and unpleasant. She noted how much power she has found in utilizing tools that are easily accessible on her phone to stay engaged in her recovery, and commented on how they keep her motivated and feeling better.

Our surgery nurse solution helps injured employees facing surgery to be better prepared physically and mentally, and to confidently steer themselves toward a faster recovery.
